

Customer story

Replay the incident before discussing technology.

Trigger: delayed appliance delivery

Workaround: repeated calls and screenshots

Desired progress: a reliable next step

Evidence: simulated customer and adviser statements

JTBD canvas

Define the progress and why it matters.

When my appliance delivery is delayed, I want to know my verified options and who owns the next step, so I can reorganize my day without chasing different teams.

A promised delivery window passes or two channels give conflicting dates.

Find a reliable next step and resolve the delivery exception without repeating context.

Feel informed and in control when plans change.

Outcomes & measures

Define useful progress before choosing an agent.

Task success and time to a reliable next step

Repeated questions across channels

Understanding of confirmed versus uncertain dates

Customer control and adviser effort

Job & data map

Connect tasks, sources and human decisions.

Recognize the problem: Capture the goal and ask only for missing essentials.

Check the facts: Retrieve order and shipping records; inspect timestamps.

Compare options: Explain verified options and policy constraints.

Resolve & follow through: Draft a case summary and route to the right owner.

Opportunity & tradeoffs

Compare alternatives on the same job.

One agent + human approval: Simple to test and operate. Keep the job and tool set small enough to inspect.

Specialist agent team: Separates responsibilities, but adds handoffs, latency and coordination failure modes.

Guided workflow + adviser: A useful baseline when the process is predictable. Handles less ambiguity autonomously.

Agent contracts

Name the responsibility, tools, input and output.

Triage: Understand the customer's goal and gather the minimum context. Tools: Case-intake form

Lookup: Check order, shipping status and source freshness. Tools: Read-only order lookup + shipment lookup

Resolution: Explain options and propose the next step. Tools: Approved policy search + draft-case tool

Human review: Resolve exceptions and authorize consequential changes. Tools: Approved service workflow

Handoffs & permissions

Make the boundary between advice and action explicit.

Carry the approved case brief and source timestamps

Keep order tools read-only

Ask for missing context; route conflicting data

Wait for authorized approval before an order change

Conversation prototype

Show the customer experience and the execution trace.

Request: My delivery is late. What can I do?

Retrieve: sample order and shipment record

Explain: status is unconfirmed; cite source

Offer: draft a handoff to an adviser

Test scorecard

Test the job, data quality and authority boundaries.

Clear source: Explain the unconfirmed status, cite the source and offer an adviser review.

Stale data: Withhold the promise, show the stale timestamp and request verification.

Conflicting dates: Surface the conflict and route it to operations; do not silently pick a date.

Missing order: Ask for a permitted lookup detail or offer secure human support.

Approval required: Draft the request and wait for authorized human review.

Decision log

Keep evidence, dissent and ownership together.

Start with one agent and a structured case brief. Owner: Agent product owner

Keep order tools read-only and expose uncertainty. Owner: Operations + engineering leads

Require human approval for consequential changes. Owner: Service owner

Pilot plan

Define the scope, measures and learning loop.

30 days: Interview recent customers, establish baselines and test one-agent and specialist designs with sample data.

60 days: Connect approved read-only tools for a limited group after the test gates pass. Monitor exceptions and human review.

90 days: Compare the pilot with the baseline and decide whether to revise, stop or widen the scope.

Customer story

Replay the incident before discussing technology.

Recent incident and circumstances

Actions and workarounds

Functional, emotional and social stakes

Sources and unresolved assumptions

JTBD canvas

Define the progress and why it matters.

When: situation and trigger

I want to: desired progress

So I can: meaningful outcome

Alternatives, anxieties and evidence needed

Outcomes & measures

Define useful progress before choosing an agent.

Observable customer progress

Baseline and proposed measure

Quality, trust and control

Advance, revise and stop criteria

Job & data map

Connect tasks, sources and human decisions.

Customer steps and human judgment

Agent tasks or fixed automation

Sources, freshness and access

Handoffs and failure paths

Opportunity & tradeoffs

Compare alternatives on the same job.

One-agent concept

Specialist-team concept

Guided-workflow baseline

Criteria, weights and dissent

Agent contracts

Name the responsibility, tools, input and output.

Agent name and job

Input and output contract

Permitted tools and data

Boundary, human owner and escalation

Handoffs & permissions

Make the boundary between advice and action explicit.

What context may travel

Source, timestamp and uncertainty

Human review trigger

Approval record and fallback

Conversation prototype

Show the customer experience and the execution trace.

Customer request and response

Prompt or behavior instruction

Tool call and sample result

Human review and failure recovery

Test scorecard

Test the job, data quality and authority boundaries.

Scenario and expected behavior

Observed behavior and evidence

Task success, trust and effort

Issue, owner and next revision

Decision log

Keep evidence, dissent and ownership together.

Decision and evidence

Dissent and alternatives

Accountable owner

Open question and next gate

Pilot plan

Define the scope, measures and learning loop.

Pilot scope and dependencies

Owners and dates

Outcome measures and monitoring

Feedback, rollback and expansion gate
